

# Il percorso di maturazione dei linfociti

# Linfomi: definizione

Tumori del sistema linfatico

Gruppo eterogeneo di malattie che si differenziano per:

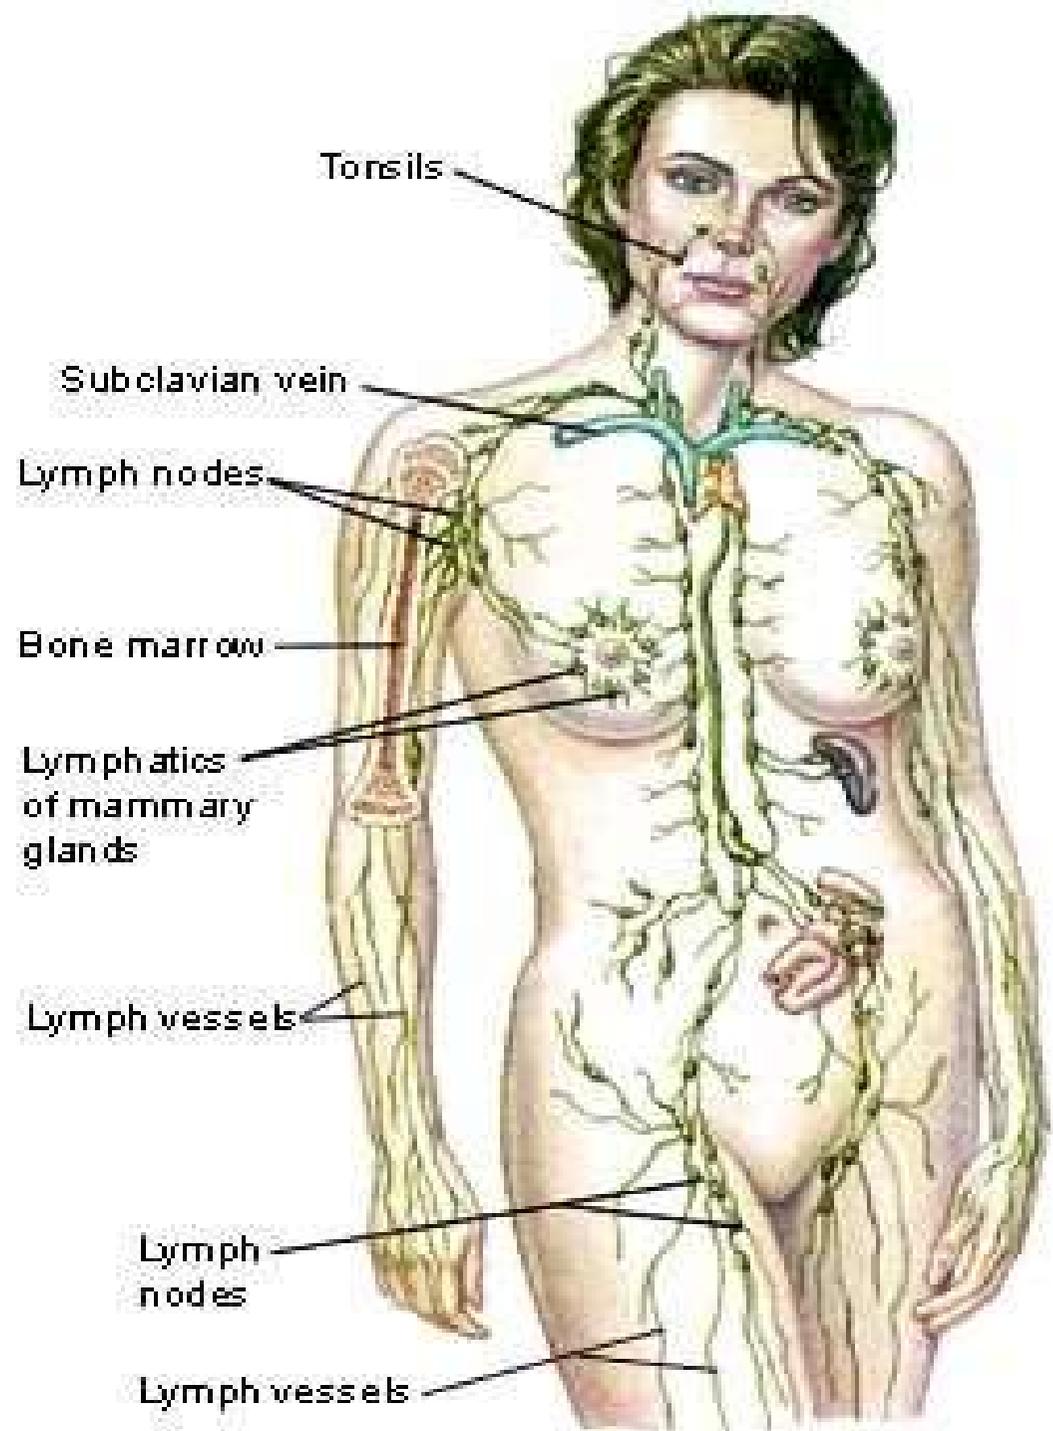

- Epidemiologia
- Eziologia
- Biologia
- Aggressività
- Presentazione clinica
- Risposta alle terapie
- Prognosi

## Sistema Immunitario Primario

- Midollo osseo
- Timo

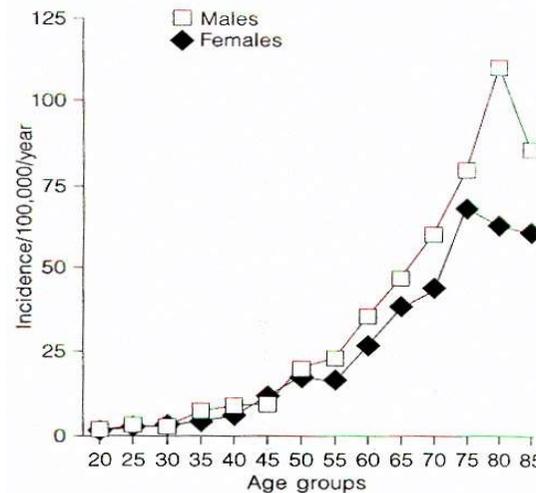

## Sistema Immunitario Secondario

- Linfonodi
- Milza
- Tessuto linfatico cute
- Tessuto linfatico intestino
- Tessuto linfatico faringe

# Linfomi: epidemiologia

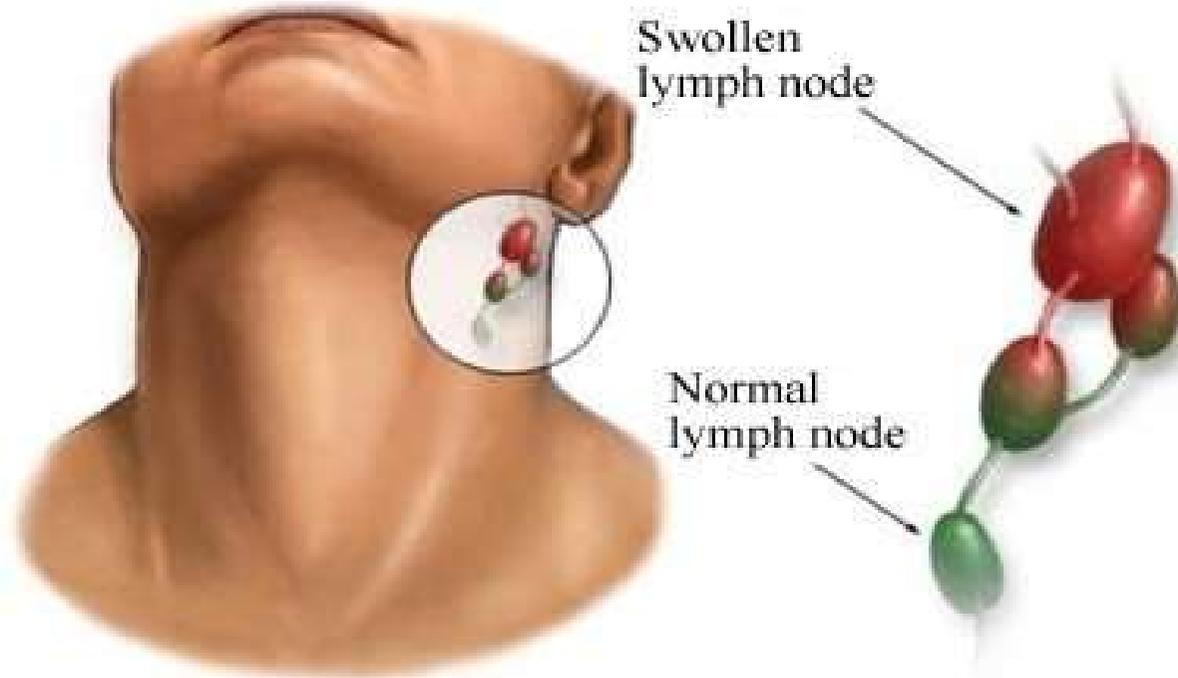

- 4% delle nuove diagnosi di tumore maligno;
- Incidenza: circa 30 nuovi casi su 100.000 abitanti anno;
- Incidenza in incremento;

- Età di insorgenza: variabile a seconda del tipo di linfoma; età media intorno ai 60-70 anni;
- Lieve prevalenza nel sesso maschile;
- Categorie a rischio: pazienti con stato di immunosoppressione o affetti da patologie del sistema immunitario (malattie autoimmuni);

# Linfomi: presentazione

## 1. Tumefazione delle sedi linfatiche coinvolte

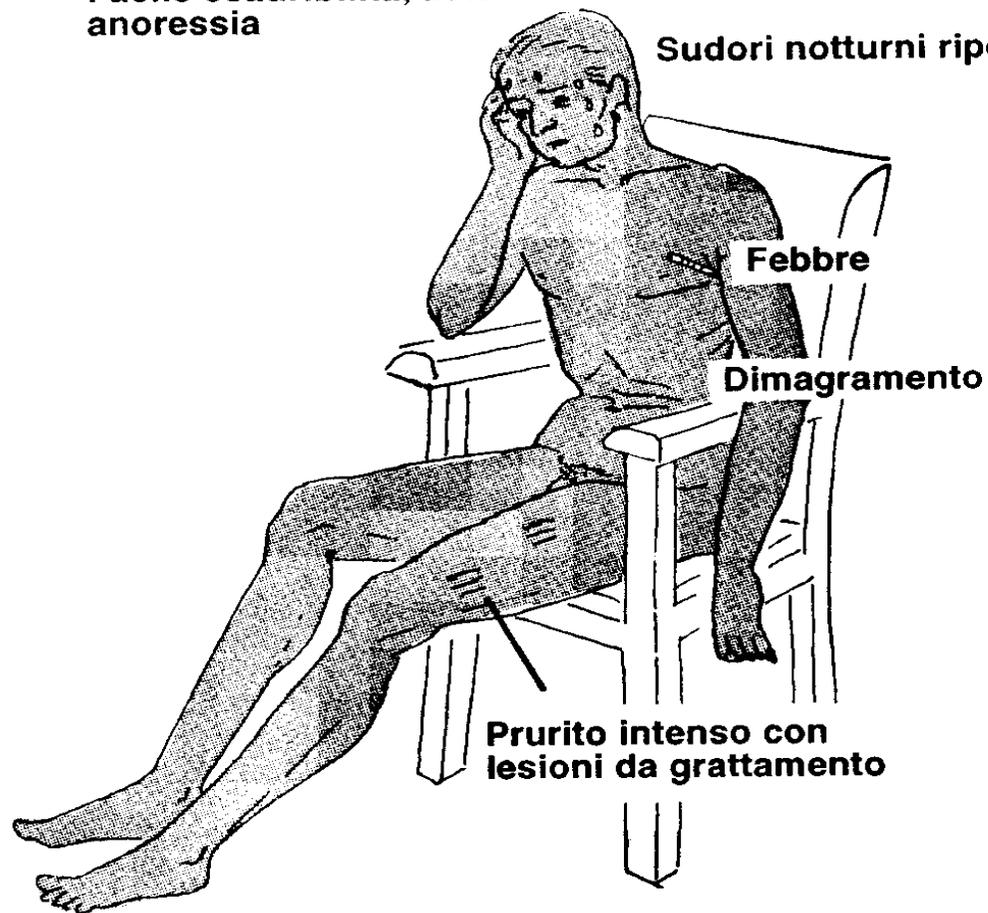

# Linfomi: presentazione

## 2. Sintomi generali

Facile esauribilità, astenia  
anoressia

Sudori notturni ripetuti

# Linfomi: presentazione

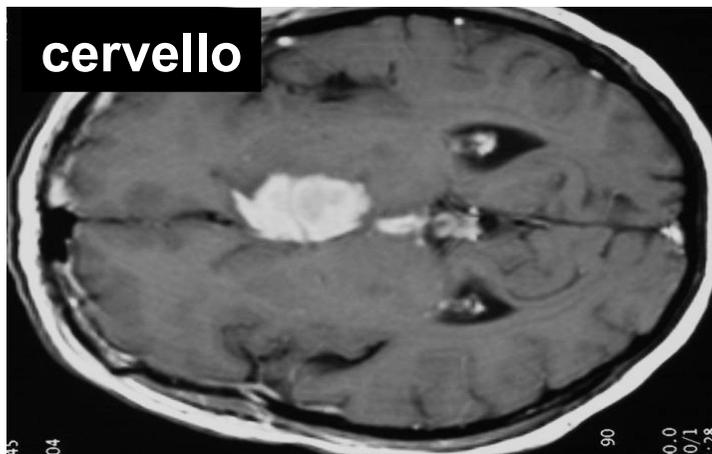

3. Stato di immunosoppressione

Maggiore ricettività alle infezioni

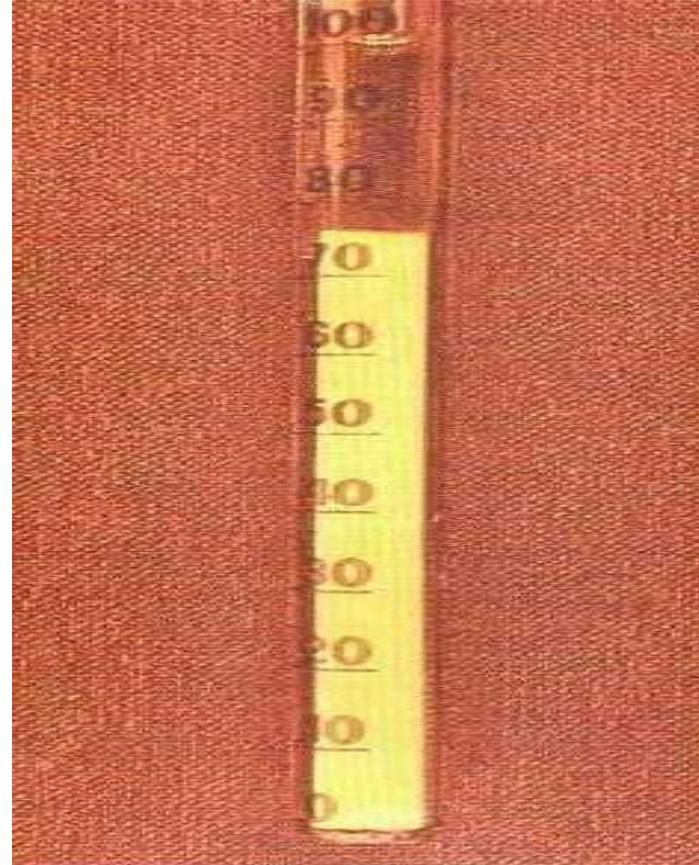

# Linfomi: presentazione

4. Possibile interessamento anche di organi non linfatici

# Linfomi: presentazione

## 5. Fenomeni particolari

# Linfomi: eziologia

1. Sconosciuta nella maggior parte dei casi
2. Agenti “inquinanti” in genere (fumo, pesticidi, radiazioni)
3. Alcuni farmaci (chemioterapici, farmaci immunosoppressori)
4. Agenti infettivi:
  - Virus (HCV, EBV, HIV, ...)
  - Batteri (Helicobacter Piloni, Chlamydia Psittaci, ...)

# DIAGNOSI

La diagnosi di linfoma deve essere

**SEMPRE**

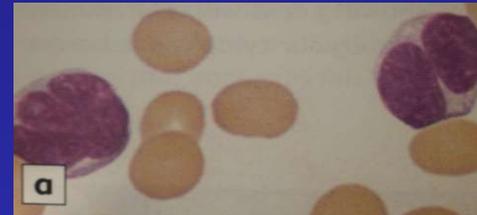

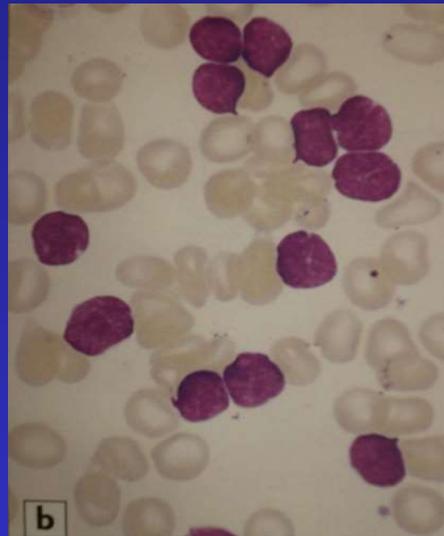

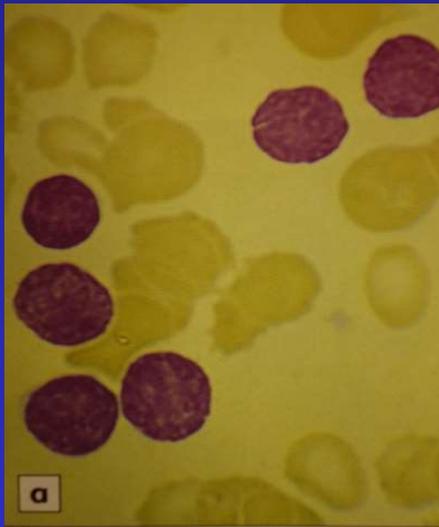

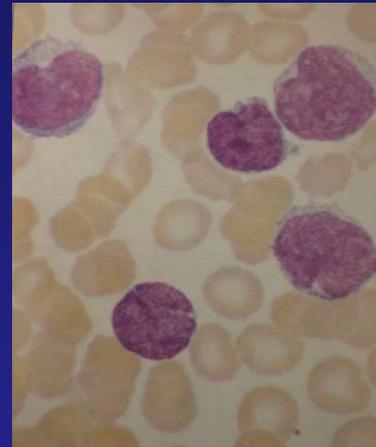

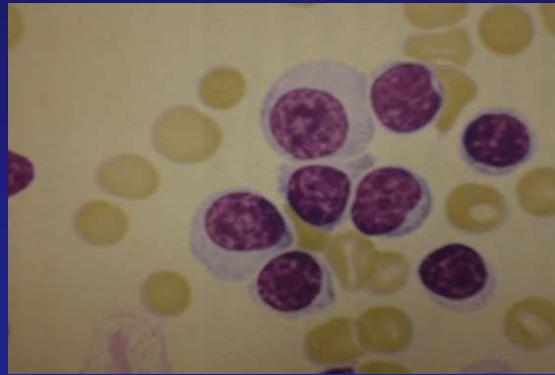

documentata istologicamente

# ~~AGOASPIRATO LINFONODALE~~

- insufficiente per iniziare una chemioterapia antitumorale
- può alterare l'architettura strutturale del linfonodo e rendere quindi problematica la diagnosi sulla successiva biopsia
- elevata percentuale di falsi positivi o negativi
- inadeguato ai fini della precisazione classificativa del linfoma
- quanto tempo ci fa perdere?

# ACCERTAMENTI DI LABORATORIO

- esame emocromocitometrico completo, con formula ed osservazione dello striscio al microscopio
- tests sierologici (mononucleosi, toxoplasmosi, HIV, CMV)
- LDH
- $\beta_2$  microglobulina
- protidemia con elettroforesi, immunodiffusione e immunofissazione

# Linfomi: diagnosi e inquadramento

- Biopsia: linfonodo e midollo osseo, altri organi
- Esame clinico
- Esami di laboratorio
- Indagini radiologiche:
  - TAC collo-torace-addome
  - Risonanza Magnetica
  - PET (TC-PET)
- Indagini particolari:
  - Puntura lombare
  - Endoscopia (stomaco, intestino)
  - Diagnostica molecolare

Ottimizzare:

- diagnosi
- prognosi
- terapia

# STADIAZIONE

Poter stratificare, attraverso l'accurata valutazione della estensione e della diffusione della neoplasia, gruppi di pazienti a diversa prognosi a lungo termine per i quali, quindi, sia possibile proporre approcci terapeutici diversificati.

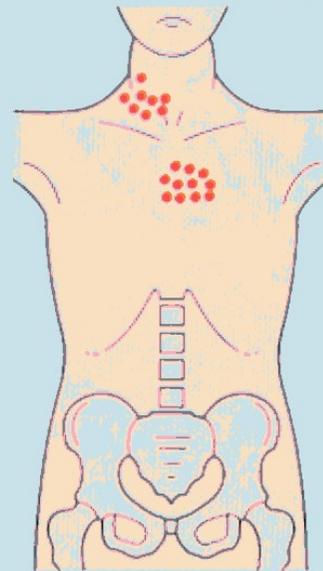

## The Ann Arbor Staging System for HL (1974)

<b>Stage</b>	<b>Anatomic Description</b>
<b>Stage I</b>	<b>Involvement of a single lymph node region (I) or a single extralymphatic organ or a site (IE)</b>
<b>Stage II</b>	<b>Involvement of 2 or more lymph node regions on the same side of the diaphragm (II) or localized involvement of an extralymphatic organ or site (IIE)</b>
<b>Stage III</b>	<b>Involvement of lymph node regions on both sides of the diaphragm without (III) or with (IIIE) localized involvement of an extralymphatic organ or site</b>
<b>Stage IV</b>	<b>Diffuse involvement of <math>\geq 1</math> extralymphatic organ or site, with or without lymphatic involvement</b>

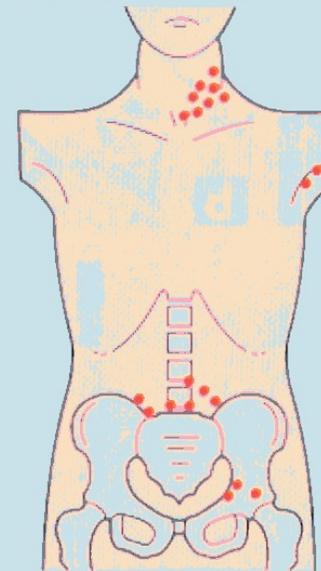

# ANN ARBOR STAGING

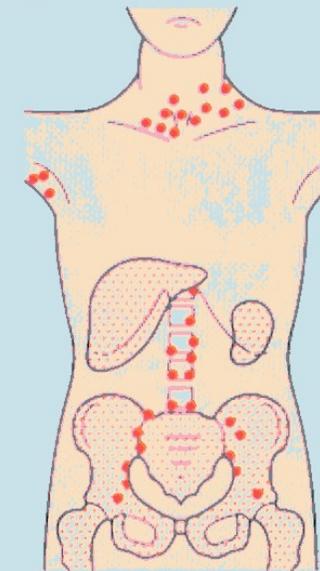

**Stage I:**  
involvement of single lymph node region or single extralymphatic site (I<sub>E</sub>)

**Stage II:**  
involvement of two or more lymph node regions on same side of diaphragm; may include localized extralymphatic involvement on same side of diaphragm (II<sub>E</sub>)

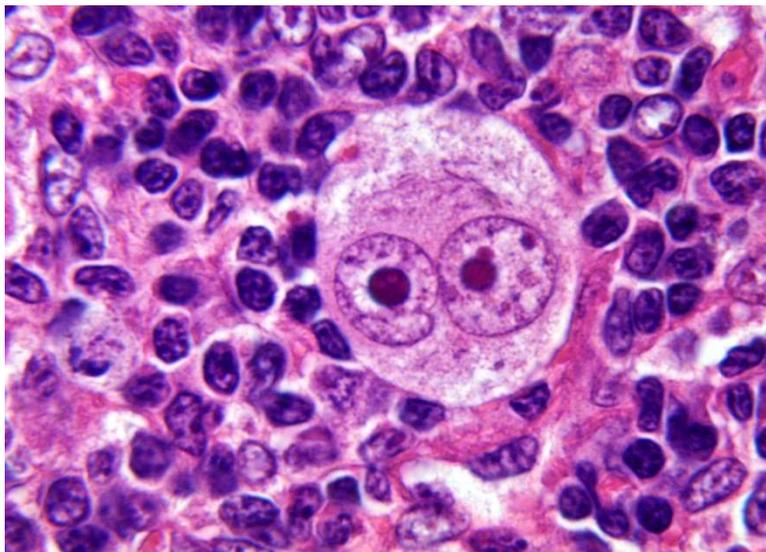

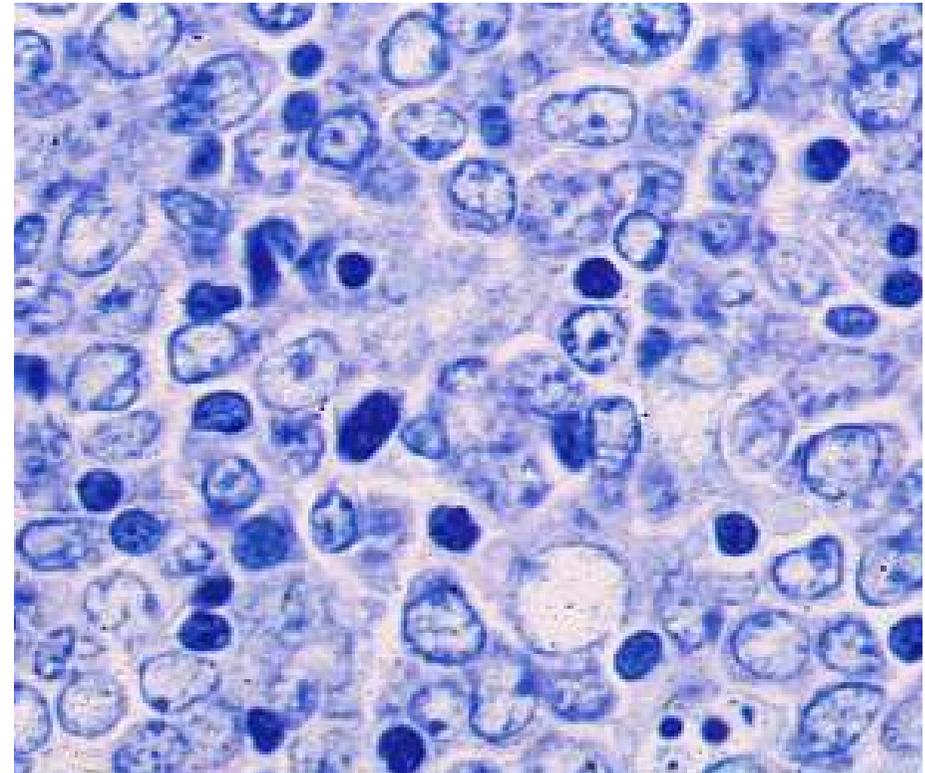

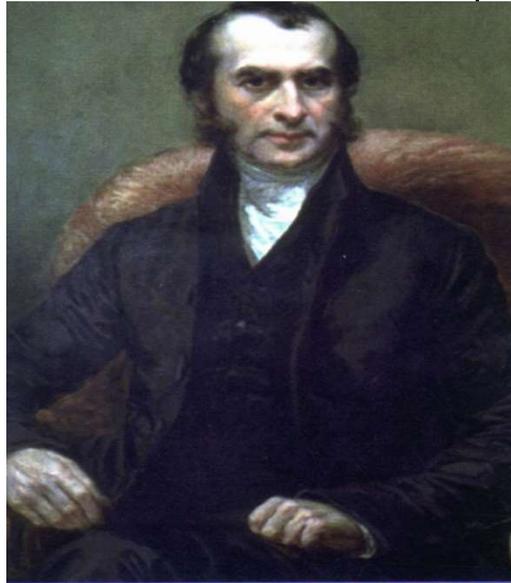

**Stage III:**  
involvement of lymph node regions on both sides of the diaphragm; may include spleen (III<sub>S</sub>) or localized extranodal disease (III<sub>E</sub>)

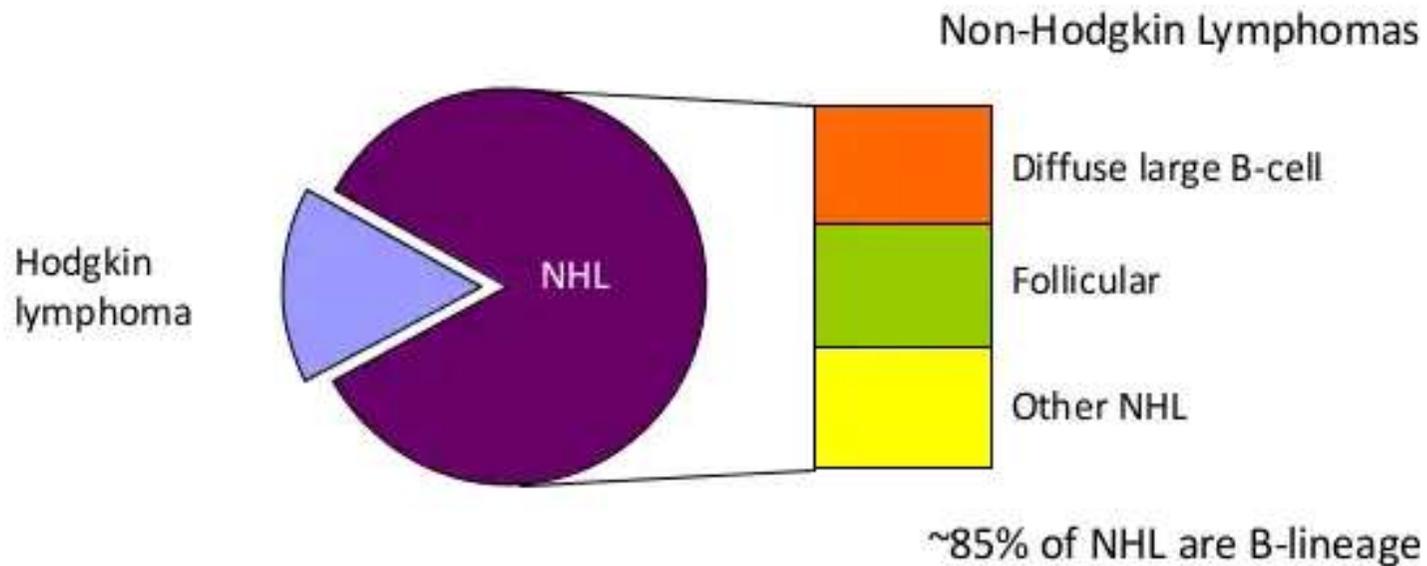

**Stage IV:**  
diffuse extralymphatic disease (e.g. in liver, bone marrow, lung, skin)

**NB:** if unexplained weight loss of >10% body weight in preceding 6 months and/or fevers of >38°C and night sweats, classified as 'B'; if absent, 'A'.

# UPDATED KIEL CLASSIFICATION

---

## *Derivazione linfocitaria B*

---

### **A basso grado di aggressività**

- Leucemia linfatica cronica
- Leucemia prolinfocitica
- Leucemia a tricoleucociti
- Linfoplasma-citico/citoide (Lp immunocitoma)
- Plasmocitoma extramidollare
- Centroblastico/centrocitico: follicolare  $\pm$  diffuso, diffuso
- Centrocitico

### **Ad alto grado di aggressività**

- Centroblastico
- Immunoblastico
- A grandi cellule anaplastiche CD30+
- Linfoma di Burkitt
- Linfoblastico

---

## *Derivazione linfocitaria T*

---

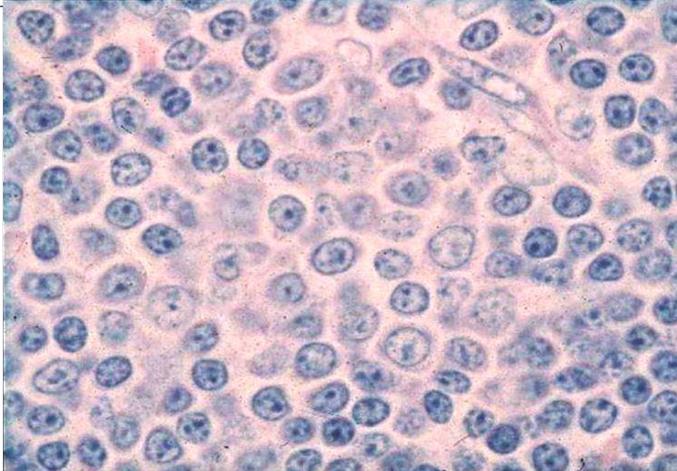

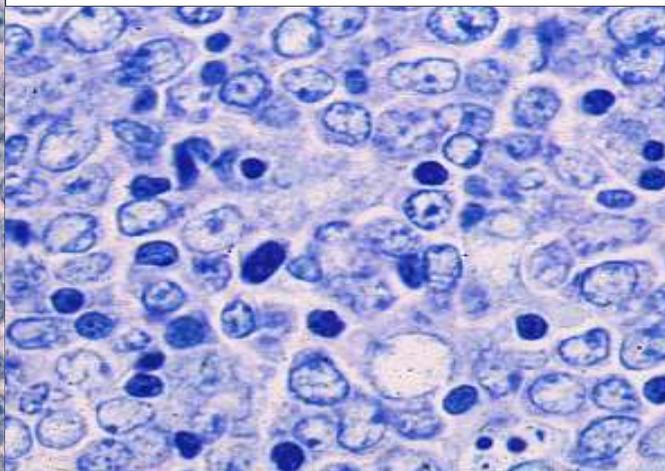

### **A basso grado di aggressività**

- Leucemia linfatica cronica
- Leucemia prolinfocitica
- A cellule cerebriformi: micosi fungoide e sindrome di Sézary
- Linfoma linfoepitelioideo (linfoma di Lennert)
- Linfoma simil-angioimmunoblastico
- Linfoma della zona T
- Linfoma a cellule T periferiche polimorfe, piccole (HTLV $\pm$ )

### **Ad alto grado di aggressività**

- Linfoma a cellule T periferiche polimorfe, medie-grandi (HTLV $\pm$ )
- Immunoblastico
- A grandi cellule anaplastiche CD30+
- Linfoblastico

# Linfomi: evoluzione

	<b>Linfomi basso grado</b>	<b>Linfomi alto grado</b>
<b>Accrescimento</b>	<b>lento</b>	<b>rapido</b>

**Table 1. 2016 WHO classification of mature lymphoid, histiocytic, and dendritic neoplasms**

<b>Mature B-cell neoplasms</b>
Chronic lymphocytic leukemia/small lymphocytic lymphoma
Monoclonal B-cell lymphocytosis*
B-cell prolymphocytic leukemia
Splenic marginal zone lymphoma
Hairy cell leukemia
<i>Splenic B-cell lymphoma/leukemia, unclassifiable</i>
<i>Splenic diffuse red pulp small B-cell lymphoma</i>
<i>Hairy cell leukemia-variant</i>
Lymphoplasmacytic lymphoma
Waldenström macroglobulinemia
Monoclonal gammopathy of undetermined significance (MGUS), IgM*
μ heavy-chain disease
γ heavy-chain disease
α heavy-chain disease
Monoclonal gammopathy of undetermined significance (MGUS), IgG/A*
Plasma cell myeloma
Solitary plasmacytoma of bone
Extracranial plasmacytoma
Monoclonal immunoglobulin deposition diseases*
Extranodal marginal zone lymphoma of mucosa-associated lymphoid tissue (MALT lymphoma)
Nodal marginal zone lymphoma
<i>Pediatric nodal marginal zone lymphoma</i>
Follicular lymphoma
In situ follicular neoplasia*
Duodenal-type follicular lymphoma*
Pediatric-type follicular lymphoma*
<i>Large B-cell lymphoma with IRF4 rearrangement*</i>
Primary cutaneous follicle center lymphoma
Mantle cell lymphoma
In situ mantle cell neoplasia*
Diffuse large B-cell lymphoma (DLBCL), NOS
Germinal center B-cell type*
Activated B-cell type*
T-cell/histiocyte-rich large B-cell lymphoma
Primary DLBCL of the central nervous system (CNS)
Primary cutaneous DLBCL, leg type
EBV <sup>+</sup> DLBCL, NOS*
<i>EBV<sup>+</sup> mucocutaneous ulcer*</i>
DLBCL associated with chronic inflammation
Lymphomatoid granulomatosis
Primary mediastinal (thymic) large B-cell lymphoma
Intravascular large B-cell lymphoma
ALK <sup>+</sup> large B-cell lymphoma
Plasmablastic lymphoma
Primary effusion lymphoma
<i>HHV8<sup>+</sup> DLBCL, NOS*</i>
Burkitt lymphoma
<i>Burkitt-like lymphoma with 11q aberration*</i>
High-grade B-cell lymphoma, with <i>MYC</i> and <i>BCL2</i> and/or <i>BCL6</i> rearrangements*
High-grade B-cell lymphoma, NOS*
B-cell lymphoma, unclassifiable, with features intermediate between DLBCL and classical Hodgkin lymphoma
<b>Mature T and NK neoplasms</b>
T-cell prolymphocytic leukemia
T-cell large granular lymphocytic leukemia
<i>Chronic lymphoproliferative disorder of NK cells</i>
Aggressive NK-cell leukemia
Systemic EBV <sup>+</sup> T-cell lymphoma of childhood*
Hydroa vacciniforme-like lymphoproliferative disorder*
Adult T-cell leukemia/lymphoma
Extranodal NK-/T-cell lymphoma, nasal type
Enteropathy-associated T-cell lymphoma

**Table 1. (continued)**

Monomorphic epitheliotropic intestinal T-cell lymphoma*
<i>Indolent T-cell lymphoproliferative disorder of the GI tract*</i>
Hepatosplenic T-cell lymphoma
Subcutaneous panniculitis-like T-cell lymphoma
Mycosis fungoides
Sézary syndrome
Primary cutaneous CD30 <sup>+</sup> T-cell lymphoproliferative disorders
Lymphomatoid papulosis
Primary cutaneous anaplastic large cell lymphoma
Primary cutaneous γδ T-cell lymphoma
<i>Primary cutaneous CD8<sup>+</sup> aggressive epidermotropic cytotoxic T-cell lymphoma</i>
<i>Primary cutaneous acral CD8<sup>+</sup> T-cell lymphoma*</i>
<i>Primary cutaneous CD4<sup>+</sup> small/medium T-cell lymphoproliferative disorder*</i>
Peripheral T-cell lymphoma, NOS
Angioimmunoblastic T-cell lymphoma
<i>Follicular T-cell lymphoma*</i>
<i>Nodal peripheral T-cell lymphoma with TFH phenotype*</i>
Anaplastic large-cell lymphoma, ALK <sup>+</sup>
Anaplastic large-cell lymphoma, ALK <sup>−</sup> *
<i>Breast implant-associated anaplastic large-cell lymphoma*</i>
<b>Hodgkin lymphoma</b>
Nodular lymphocyte predominant Hodgkin lymphoma
Classical Hodgkin lymphoma
Nodular sclerosis classical Hodgkin lymphoma
Lymphocyte-rich classical Hodgkin lymphoma
Mixed cellularity classical Hodgkin lymphoma
Lymphocyte-depleted classical Hodgkin lymphoma
<b>Posttransplant lymphoproliferative disorders (PTLD)</b>
Plasmacytic hyperplasia PTLD
Infectious mononucleosis PTLD
Florid follicular hyperplasia PTLD*
Polymorphic PTLD
Monomorphic PTLD (B- and T-/NK-cell types)
Classical Hodgkin lymphoma PTLD
<b>Histiocytic and dendritic cell neoplasms</b>
Histiocytic sarcoma
Langerhans cell histiocytosis
Langerhans cell sarcoma
Indeterminate dendritic cell tumor
Interdigitating dendritic cell sarcoma
Follicular dendritic cell sarcoma
Fibroblastic reticular cell tumor
Disseminated juvenile xanthogranuloma
Erdheim-Chester disease*

# B CELL LYMPHOMA: CELLULAR ORIGIN

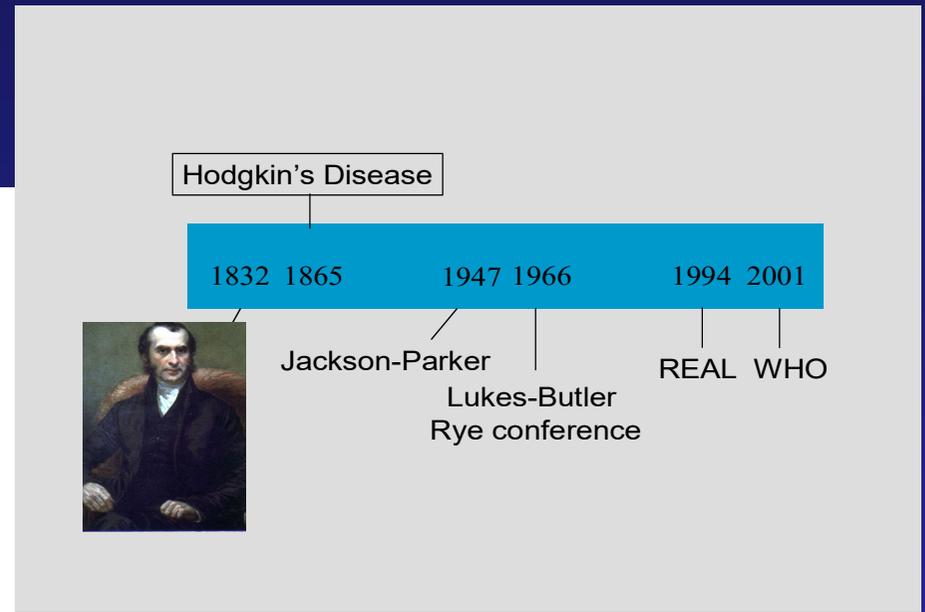

# I LINFOMI DI HODGKIN

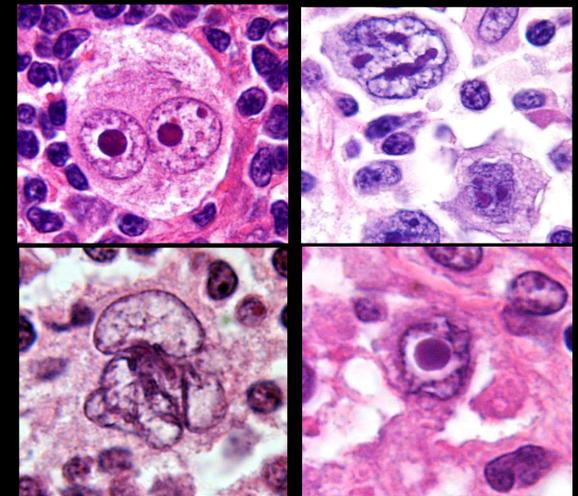

# Introduction

- Are group of cancers which originate from lymphatic systems.
- It was named after Thomas Hodgkin who first described it in 1832.
- Dorothy Reed and Carl Sternberg first described the malignant cells of Hodgkin lymphoma call Reed Sternberg cells.
- Hodgkin lymphoma was the first cancer which could be successfully treated by radiation therapy and also by combination chemotherapy.

## Linfoma di Hodgkin: natura cellulare

- Endothelial cells
- Histiocytes
- Myeloid cells
- Dendritic cells
- Cell chimera
- T Lymphocytes
- B Lymphocytes

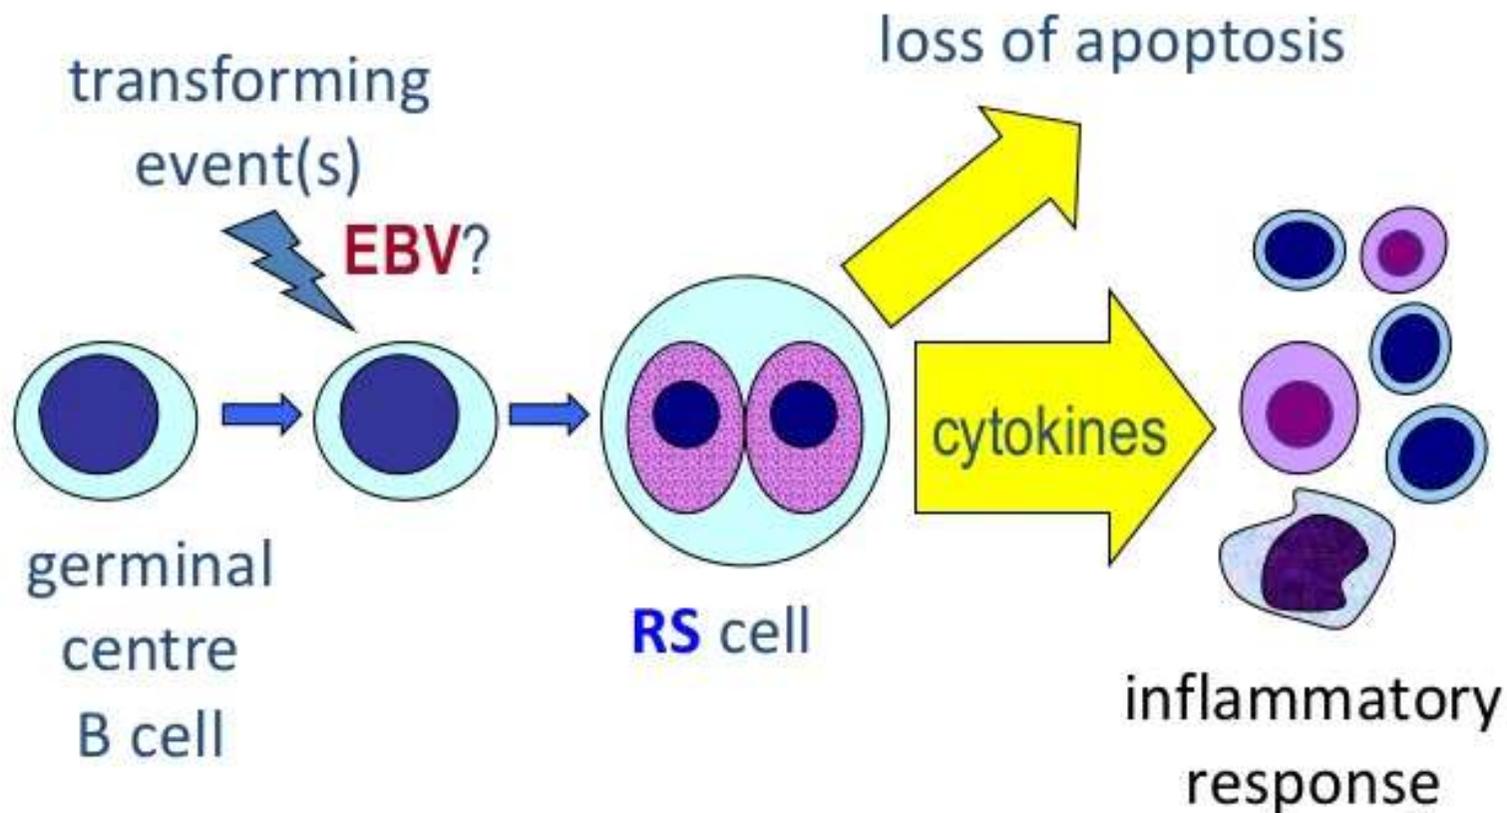

# Reed Sternberg cell

## Common feature of ALL Hodgkin Lymphomas.

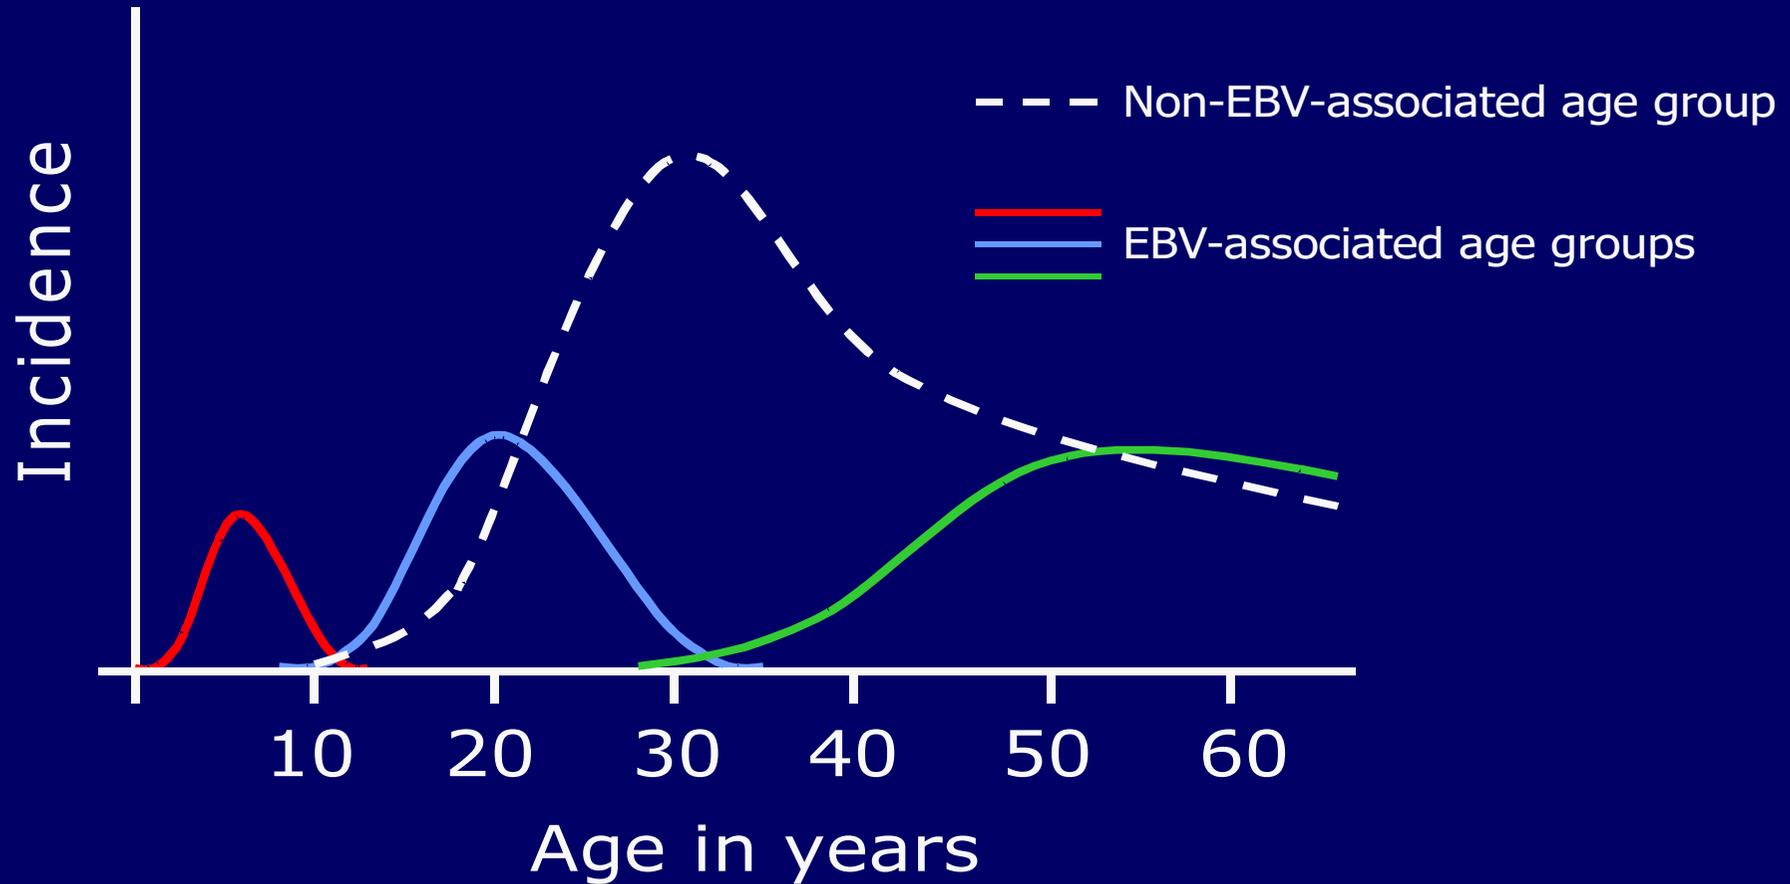

- Large cells ( >45um in diameter) with classically binucleate or bilobed central nucleus each with a large acidophilic central nucleoli surrounded by a clear halo. “owl’s eye appearance”
- **Variants:** *mononuclear (Hodgkin’s cell), mummified cell, lacunar cell, L/H cell.*
- Requirement of Reed-Sternberg cell for initial diagnosis is “absolute”(less strict for LPHL or recurrent disease)
- Classic Reed-Sternberg cell:
  - + **CD15, CD30, CD25**
  - **CD45, pan-B, S-100, keratin, EMA**
- Most current studies indicate the RS cells of HL are lymphocytic in nature and, in the great majority of cases, are of B-cell origin.

## A possible model of pathogenesis

# Four disease model of HD

*Jarret R.F., Annals of Oncology (2002)*

# Risk Factors

- No clear risk factors, several implicated
  - EBV (pathogen or passenger)
  - HIV
  - woodworking, farming
  - rare familial aggregations
- First degree relatives have five fold increase in risk for Hodgkin lymphoma.
- Associated with EBV infection mainly with mixed cellularity type.
- High socio economic status.
- Prolonged use of of human growth hormone.
- men > women
- whites > blacks > Asians

# Clinical features

- Most common presentation is **asymptomatic lymphnode enlargement**, typically in the neck.
- Cervical lymphnodes are involved in 80% cases.
- Mediastinal involvement is seen in about 50% cases. They produce symptoms like chest pain, cough and dyspnoea.
- Infradiaphragmatic involvement is seen in 5% cases and usually seen with older patients.
- Other less common symptoms are :

*Pruritis, alcohol induced pain over involved lymphnodes, nephrotic syndrome, erythema nodosum, cerebellar degeneration, immune hemolytic anaemia, thrombocytopenia, hypercalcemia.*

# B symptoms

- About 33 % present with B symptoms overall
- Only 15-20% of stage I-III have B symptoms like
  1. **Fever(>38°C)**
    - May first present as fever of unknown origin
    - Fever persists for days to weeks followed by afebrile intervals and then recurrence.
    - This pattern is called Pel Ebstein fever.
  2. **Drenching night sweats**
  3. **Weight loss (>10% in 6 months)**

# Diagnostic workup

- **History**
- **Complete physical examination**
- **Confirmatory workup**
  - Excisional biopsy of the lymph node
- **Staging workup**
  - Chest x ray(pa,lat)
  - Usg neck,whole abdomen
  - CT scan thorax,abdomen and pelvis
  - FDG PET scan

- Routine blood investigations

- Complete blood count

- Liver function

- Renal function

- Serum albumin

- ESR

- Lactate Dehydrogenase

- ☐ OTHERS

- Bone marrow biopsy

15

## Bone Marrow Biopsy

- Less commonly put into practice
- Overall involvement of bone marrow in Hodgkins lymphoma is 5%.
- Indicated in pts with
  - B symptoms
  - Clinical evidence of sub diaphragmatic disease
  - Stage iii-iv
  - Recurrent disease

16

## 2008 WHO Classification of Hodgkin Lymphoma

	Histologic Subtypes
	Nodular lymphocyte predominant Hodgkins lymphoma (NLPHL)
	Classical Hodgkins lymphoma(CHL)
1	Nodular sclerosis Hodgkins lymphoma
2	Lymphocyte rich classical Hodgkins lymphoma
3	Mixed cellularity Hodgkins lymphoma
4	Lymphocyte depletion Hodgkin lymphoma

# I LINFOMI

## PRINCIPI DI TERAPIA

# Linfomi: terapia

- Non sempre necessaria (linfomi basso grado) nelle prima fasi della malattia;
- Chemioterapia;
- Immunoterapia;
- Radioterapia;
  
- Farmaci ad uso orale o ev;
- In monoterapia o in combinazione (cicli di terapia);
- Trapianto di cellule staminali emopoietiche;
- Nuovi farmaci in studio;

# Linfomi: obiettivi della terapia

Funzione di:

- Tipo di linfoma;
- Età, caratteristiche e problematiche del paziente;

**GUARIGIONE**

**CONTENIMENTO**

53

## Radiotherapy

- Radiation therapy is the most effective single therapeutic agent for treating Hodgkin lymphoma.
- The main objective of radiation in Hodgkin lymphoma is to treat involved and contiguous field.
- Radiotherapy can be given by
  1. 2D planning
  2. 3D planning
  3. IFRT
- Involved field radiotherapy is the most commonly used technique at present. It targets a smaller area rather than a classical extended field.

54

# Immunotherapy (NIVOLUMAB)

# **I LINFOMI NON HODGKIN**

## **PRINCIPI DI TERAPIA**

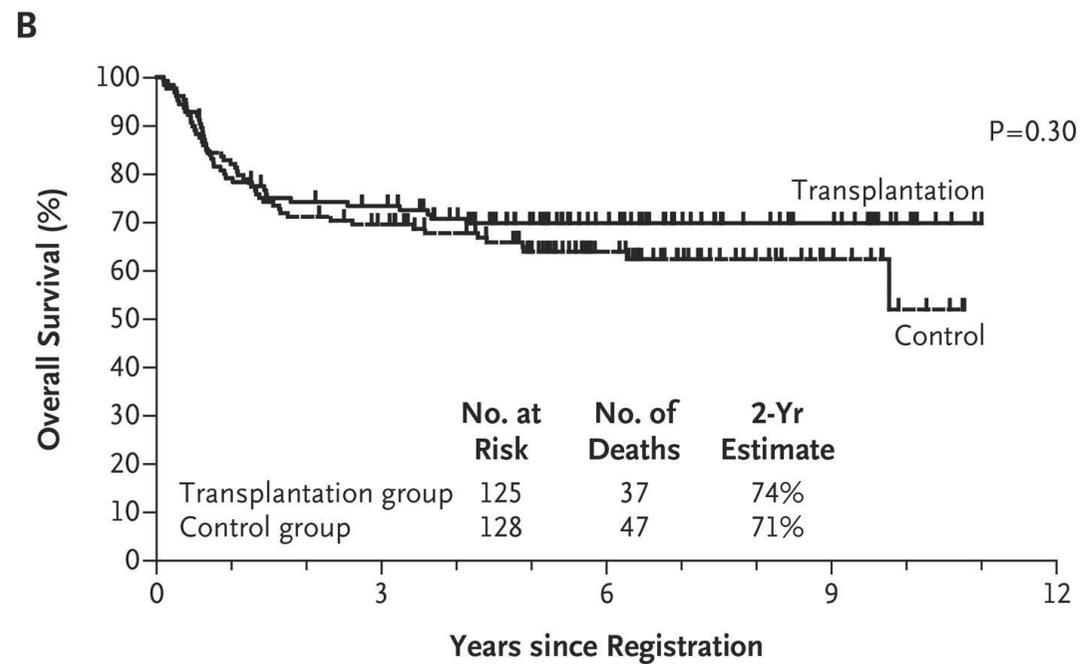

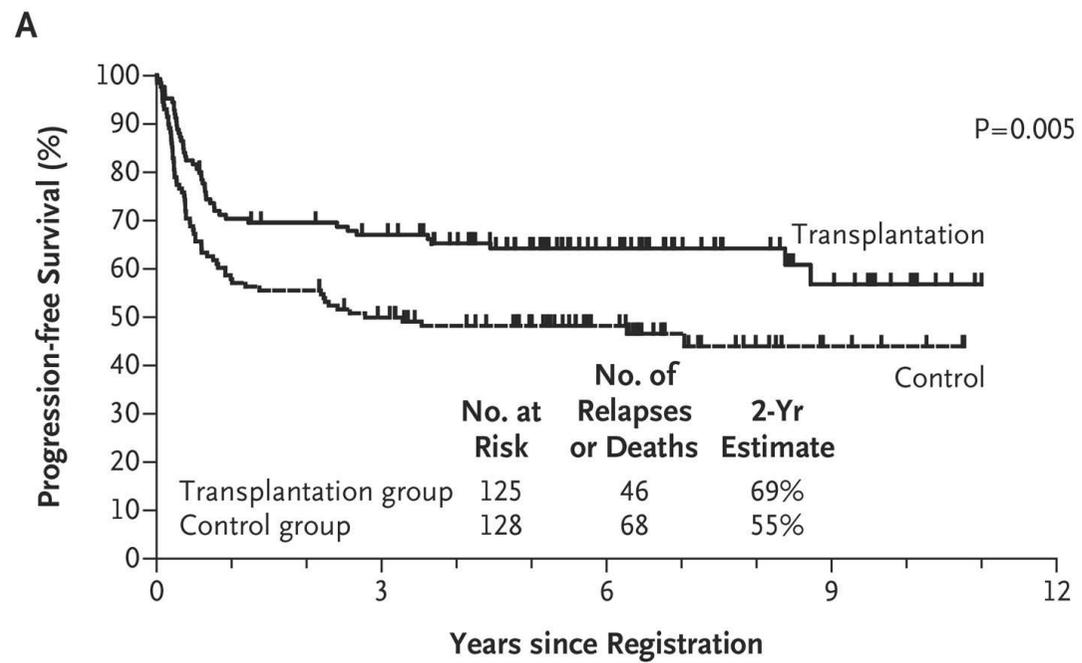

**Table 1** The CHOP Regimen

Drug	Dose	Route	Treatment day
Cyclophosphamide	750 mg/m <sup>2</sup>	IV	1
Doxorubicin	50 mg/m <sup>2</sup>	IV	1
Vincristine	1.4 mg/m <sup>2</sup>	IV	1
Prednisone	100 mg	Oral	1-5

CHOP indicates cyclophosphamide, doxorubicin, vincristine, and prednisone; IV, intravenous.
