

The Car-T cells Therapy in Hemattology

Dr. Simona Bernardi

31st May 2024

Agenda

1. What Car-T cells are and how they are produced
2. The Car-T cells efficacy and toxicity
3. The related biological studies
4. Future perspectives

Definition

The CAR-T cells are an innovative therapy for hematological malignancies. The therapy is based on T lymphocytes that are isolated, engineered to express the Car, and reinfused to the patient. The final aim is to make them competent against the malignant cells population.

Therapeutic indication in hematology

APPROVED

- Diffuse large B cell lymphoma
- Primitive mediastinal lymphoma
- Mantle lymphoma
- Follicular lymphoma
- Refractory ALL

SOON

- Multiple myeloma
- AML

IN DEVELOPMENT

- Allogeneic Car-T

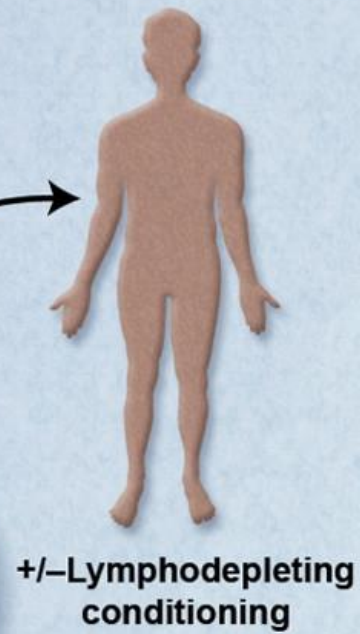

1) T Cell Collection

2) T Cell Transfection

3) T Cell Adoptive Transfer

4) Patient Monitoring

- a) Disease response
 - CT scans
 - Bone marrow biopsies
 - Peripheral blood flow cytometry
- b) CAR-T Cell persistence
 - Immunohistochemistry of bone marrow biopsy
 - RT-PCR and flow cytometry of blood and bone marrow aspirate

Randomized Ph3 Studies (CAR-T vs. SOC ASCT): EFS

ZUMA-7

Median EFS = 8.3 vs. 2 mons

1. Progression or death
2. New treatment
3. No CR/PR by 150 days

ORR: 83% vs. 50%
CR: 65% vs. 32%

BELINDA

Median EFS = 3 vs. 3 mons

1. Progression or death
2. SD/PD @/after 12wks

ORR: 46.3% vs. 42.5%
CR: 28.4% vs. 27.5%

Primary EFS endpoint: Axi-cel is superior to SOC

Median FU: 24.9 months

HR 0.398 (95% CI, 0.308-0.514), *P*<0.0001

	Median EFS (95% CI), mo	24-mo EFS Rate (95% CI), %
Axi-cel (N=180)	8.3 (4.5-15.8)	40.5% (33.2-47.7)
SOC (N=179)	2.0 (1.6-2.8)	16.3% (11.1-22.2)

Factors affecting CAR-T efficacy

Tumor

- Tumor burden
- Antigen density
- Antigen loss
- CD58 loss
- Tumor subtype
- Microenvironment

Host

- Age / Performance status
- Comorbidities
- Inflammatory state
- Conditioning
- Immune cell fitness
- Prior therapies
- Microbiome

CAR-T

- Dose
- Binder – scFv
- Signaling domains
- Hinge/TM
- Phenotype
- Polyfunctionality
- Composition

Outcome based on patient's characteristics

Axi-cel in the real-world setting Progression Free Survival

ECOG PS

N = 275

No. at risk:	0	3	6	9	12	15	18	21
ECOG PS 0-1	231	172	137	115	82	31	6	0
ECOG PS 2-4	44	25	14	9	5	3	1	0

Comorbidities

N = 275

No. at risk:	0	3	6	9	12	15	18	21
No	110	71	53	39	27	10	3	0
Yes	165	126	98	85	60	24	4	0

Progression Free Survival

Outcome based on CAR-T cells characteristics

Key Findings from scRNAseq data on Tisa-cel and Axi-cel

Early toxicity post CD19 Car-T

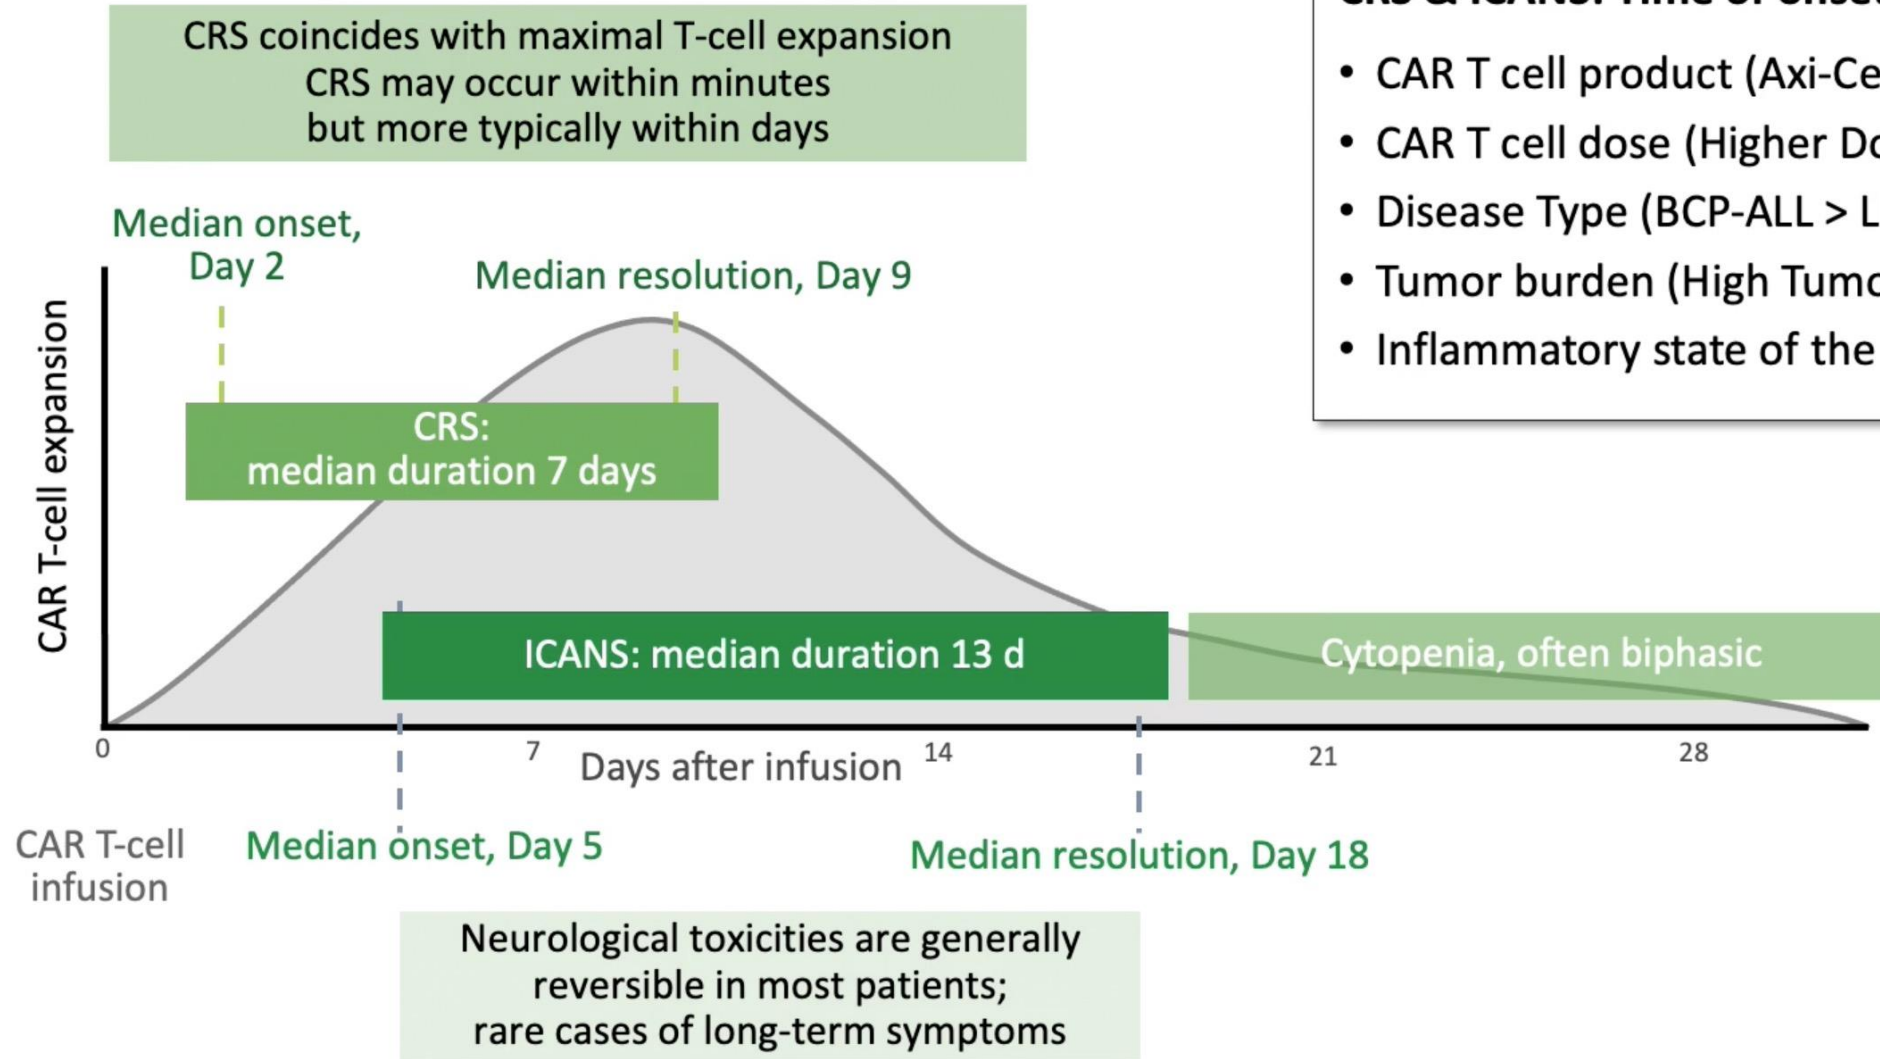

CRS

ICANS

Cytopenia

Early Toxicity post CD19 CAR-T

CRS & ICANS: Time of onset & duration depends on

- CAR T cell product (Axi-Cel > Tisa-Cel)
- CAR T cell dose (Higher Dose)
- Disease Type (BCP-ALL > LBCL)
- Tumor burden (High Tumor Volume)
- Inflammatory state of the patient (Ferritin, CRP)

Clinical manifestations

CRS: Cytokine Release Syndrome

The most common

Fever, hypotension, hypoxia

Rapidly fatal

Based on endogenous or infused T cells over-activation

ICANS: Immune effector cell-associated neurotoxicity syndrome

The second most common

Involves the CNS and results in the activation or engagement of endogenous or infused T cells and/or other immune effector cells.

Cytopenia

“on-target, off-tumor” effect

B-cell aplasia, which results in cytopenias and hypogammaglobulinemia.

Typically occurs within the first 30 days after cell infusion, but can take months to resolve

...from the lab point of view

CRS: Cytokine Release Syndrome

Transaminitis (within 2/3 w)

Coagulopathy

Ferritin and CRP ↑

NO hyperphosphatemia,
hyperuricemia, hypocalcemia,
and hyperkalemia

ICANS: Immune effector cell-associated neurotoxicity syndrome

Microbiological investigation and coagulation assessment in order to differentially diagnose infections and stroke

Cytopenia

Closely monitoring of blood cells count

Proteinemia

...from the pathogenic point of view

EVASIET Project

EVASIET Project

CAR-T toxicities at different times

SHORT-TERM:

- CRS
- ICANS
- Infections
- Cytopenias
- HLH/MAS
- ...

MIDDLE-TERM:

- Chronic neutropenia
- Hypogammaglobulinemia
- B-cell aplasia
- Infections
- CD19- relapse

LONG-TERM:

- Secondary malignancies?
- Cognitive defects?
- Transmission to the offspring

Outpatient CAR-T therapy

CAR-T *earlier* in the treatment plan

Car-T administration at ASST Spedali Civili

Summary

- Anti CD19 CAR-T cells are **highly effective therapy in DLBCL patients with ≥ 3 line of treatment** (FDA; EMA; AIFA approval) both in pivotal trials and real life experience. Axi-cel and Liso-cel have higher efficacy compared with SOC (HD chemo+ASCT) in primary refractory DLBCL patients or in patients who relapse within 12 months of 1st line of treatment. CAR-T cells are the only available therapy for some lymphomas.
- **Patients, disease and CAR-T cells characteristics may influence CAR-T cell efficacy.**
- **The toxicity** of Car-T is an important aspect that must be considered and discussed in a multidisciplinary team.
- **The future** of CAR-T therapy (... and lymphomas patients) is **bright**: new CAR-T constructs, CAR-T from alternative source, outpatient administration, use of CAR-T earlier in treatment plan.
